

Global Coupled model development across timescales

CAWCR 9th Annual Workshop, BoM Melbourne, 19–22 October 2015

David Walters, Ed Blockley, John Edwards, Helene Hewitt,
Tim Johns, Sean Milton and Keith Williams

Outline

This presentation covers the following areas

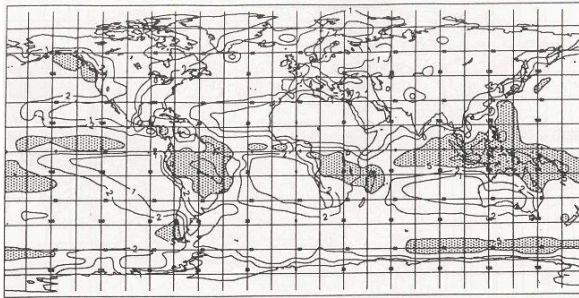

- Global Atmosphere development across timescales
- Global coupled model development
 - Seasonal-to-climate
 - Global coupled NWP
- Global Coupled development across timescales

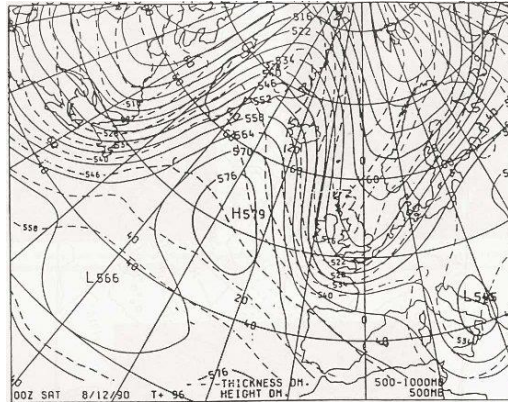

Global Atmosphere development across timescales

Unified forecast/climate model

Cullen (1993)

Global coupled climate

Global NWP

Mesoscale NWP

- Common control/infrastructure
- Common grid structure/dynamical core
- Access to common set of parametrisation schemes selected by user
- Common diagnostic/processing code
- Later drive to make model portable across architectures

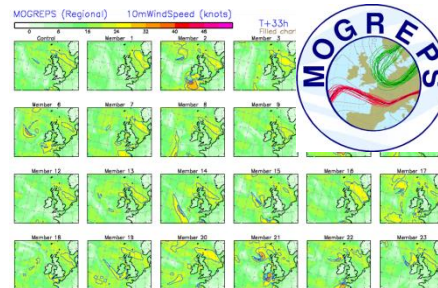

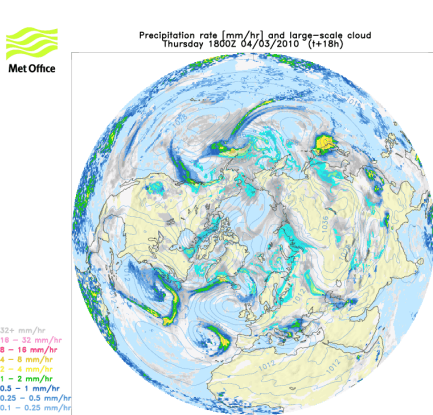

Unifying the Unified Model

Synergies between NWP models and GCMs

Senior et al. (2010)

Timescale

Resolution

- Many model characteristics present across all timescales

- Long runs to compare NWP models with climatologies

- Short runs with assimilation to study error growth in climate models

UM community well placed to take advantage of these synergies
 → Develop single scientific configuration for use at all timescales

Global Atmosphere 6.0

UM Global Atmosphere Configuration

<https://code.metoffice.gov.uk/trac/GA>

N96 (~135km) → ~12km

What is Global Atmosphere/GA6.0?

- Science config. of Unified Model
- Defined set of physics/dynamics settings
- Non-convective permitting resolutions
 - Global N96 → Regional 12km?
- Timescales from day 1 to 100s years
- Various system dependent options
 - e.g. energy/moisture conservation
 - Prognostic vs. clim. Aerosols
- Developed with community of UM partners and academic collaborators

Global Land 6.0

JULES Global Land Configuration

<https://code.metoffice.gov.uk/trac/GL>

What is Global Land/GL6.0?

- Science config. of JULES model
- Developed for use with UM GA configs
- Can also be run in offline JULES
- Developed with UM GA developers with increased input from JULES modelling community anticipated

GA6.0/GL6.0 & GA6.1/GL6.1

Combined GA/GL configurations

Global/regional
deterministic NWP

MOGREPS-G
short-range EPS

AMIP-like climate
simulations

 6.0/6.1

N96 (~135km) → ~10km

 6.0/6.1
 JULES Joint UK Land Environment Simulator

- Run with other components (e.g. ACCESS)

- LS DA
- Offline JULES

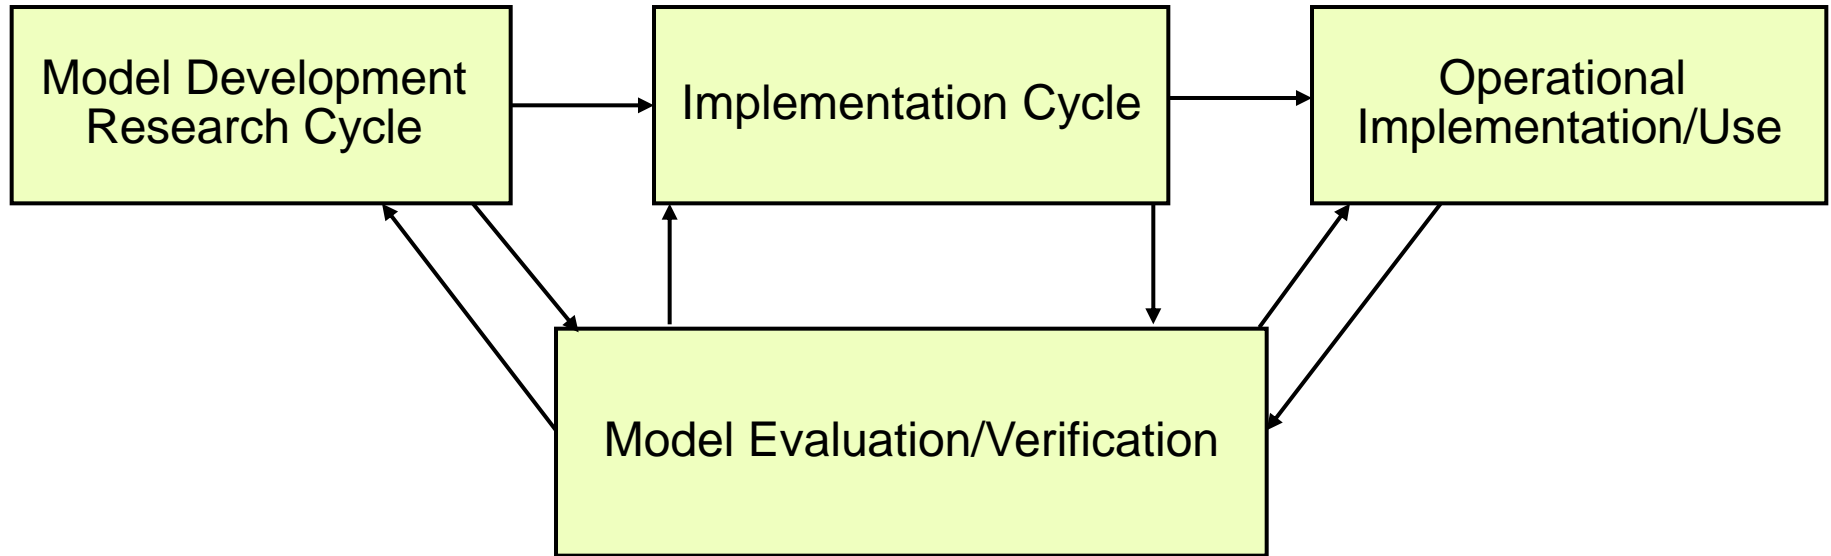

Global model development

Process design

Multi-year timescales

Annual release cycle

System dependent

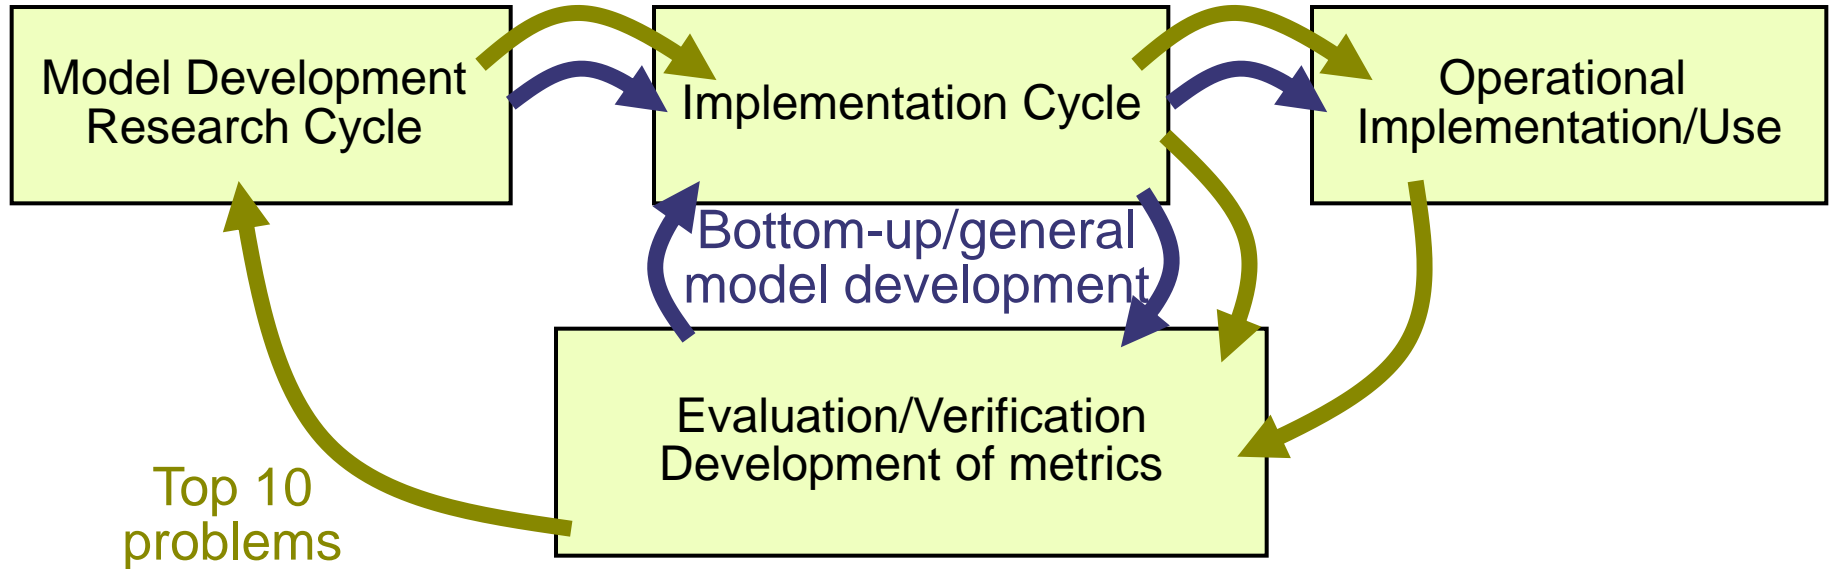

Global model development

Typical workflows

Multi-year timescales

Annual release cycle

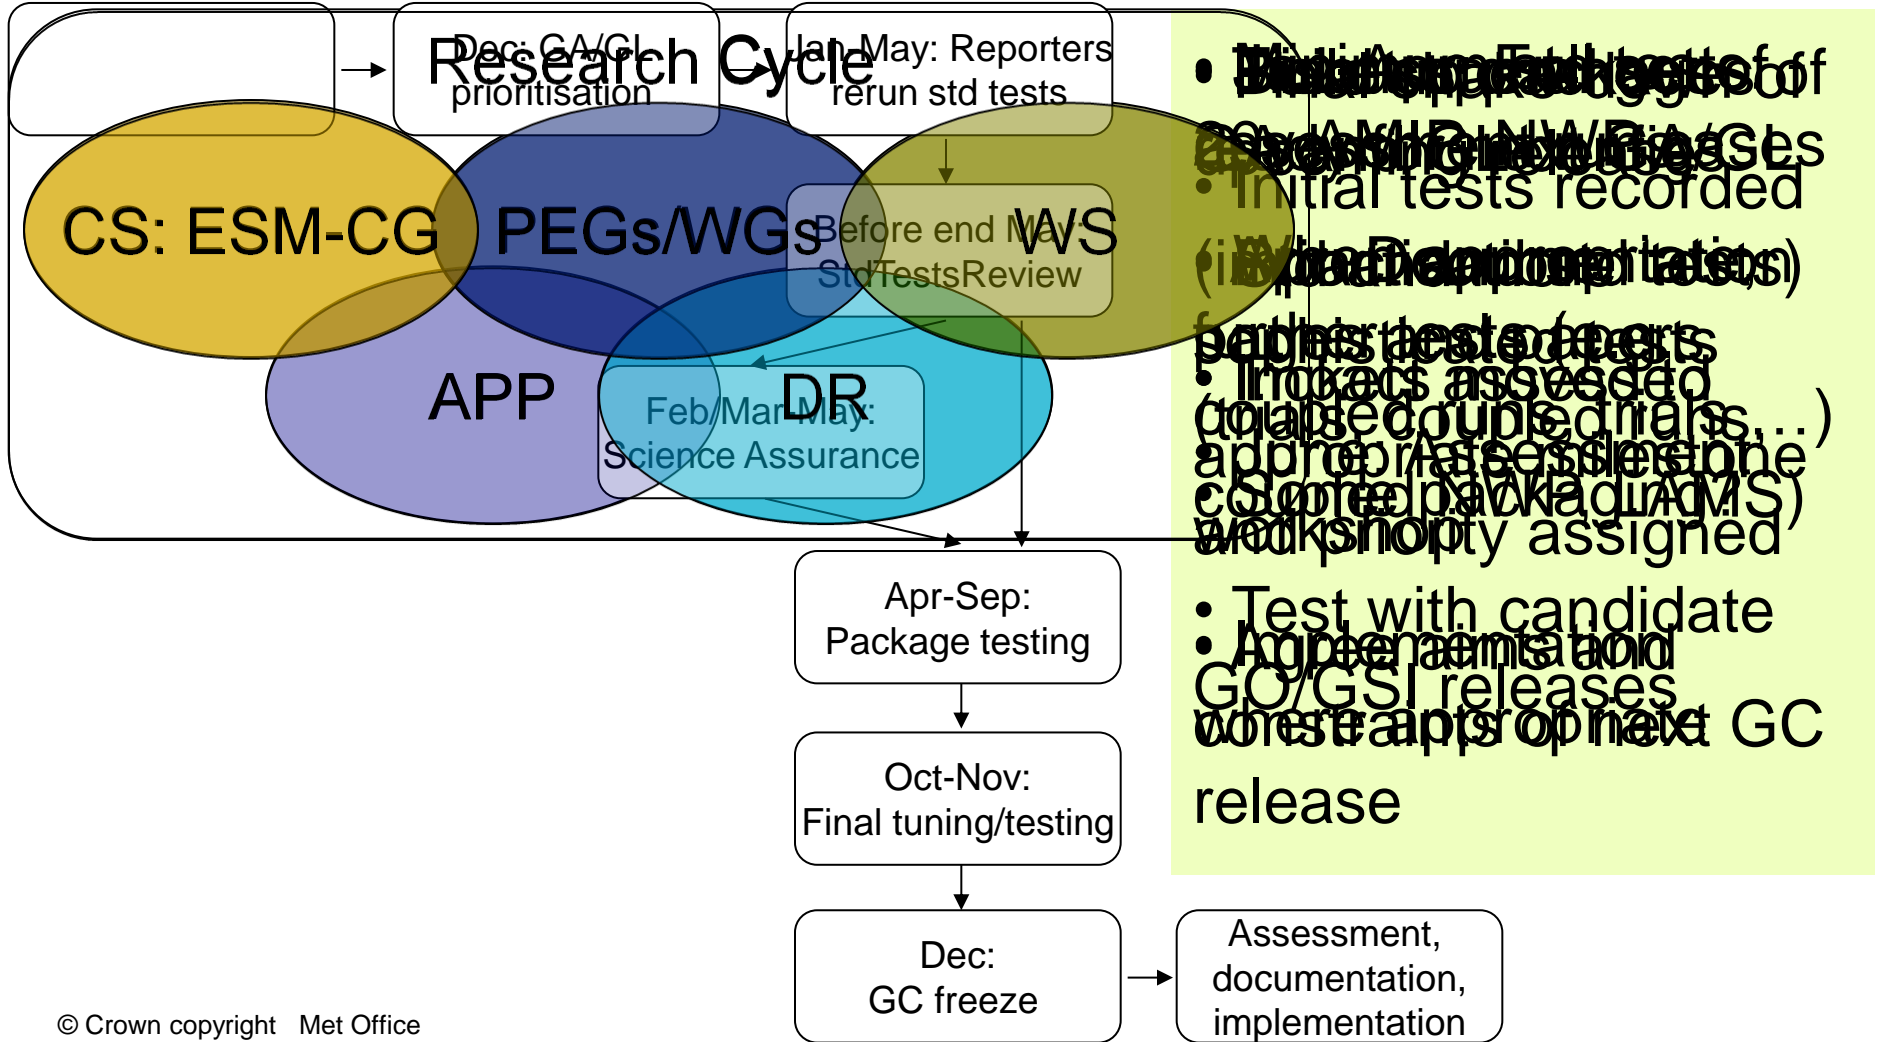

System dependent

GA development

Template for the implementation cycle

- Initial tests recorded
- (i) Initial development tests
- (ii) Candidate package tests
- Projects assessed (table driven, ...)
- appropriate assessment (e.g. Score Pack, ADM, S) workshop assigned
- Test with candidate
- Agreement on GO/GSI releases
- constraints of next GC release

Met Office

Global coupled development

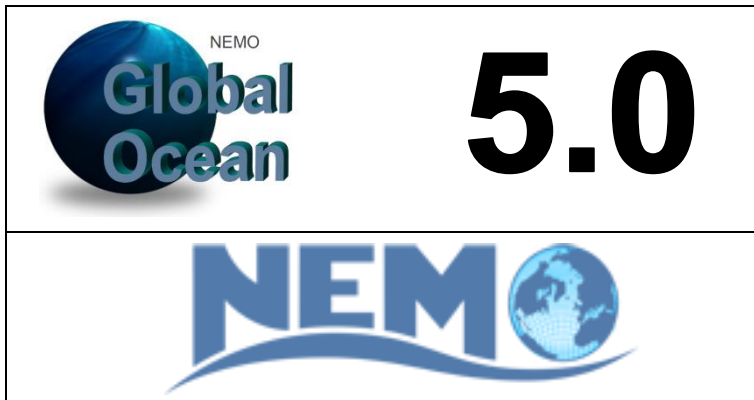

Seasonal-to-climate timescales and global coupled NWP

Global Ocean 5.0

NEMO Global Ocean Configuration

<https://code.metoffice.gov.uk/trac/GO>

ORCA025 (0.25°)

What is Global Ocean/GO5.0?

- Science config. of NEMO ocean model
- Defined grid and set of model settings
- Currently uses only ORCA025 resolution
- Developed through UK Joint Ocean Modelling Programme (JOMP) with MO/NOC/BAS

Global Sea Ice 6.0

CICE Global Sea Ice Configuration

<https://code.metoffice.gov.uk/trac/GSI>

ORCA025 → **ORCA1 (1°)**

What is Global Sea Ice/GSI6.0?

- Science config. of CICE sea ice model
- Developed for use with NEMO GO configs
- Has been run at ORCA025 and ORCA1
- Developed through UK Joint Sea Ice Modelling Programme (JSIMP) with MO/CPOM/NOC/BAS

GO5.0/GSI6.0

Combined GO/GSI configurations

Ocean reanalysis

Ocean forecasting

 NEMO	5.0
	

ORCA025 (0.25°)

 CICE	6.0
 The Los Alamos Sea Ice Model	

ORCA025 → ORCA1 (1°)

• Run with other ice models

• Offline CICE
• Could be run with other oceans (e.g. ACCESS)

Global Coupled configuration

GC2.0 and its components

Coupled NWP/assimilation

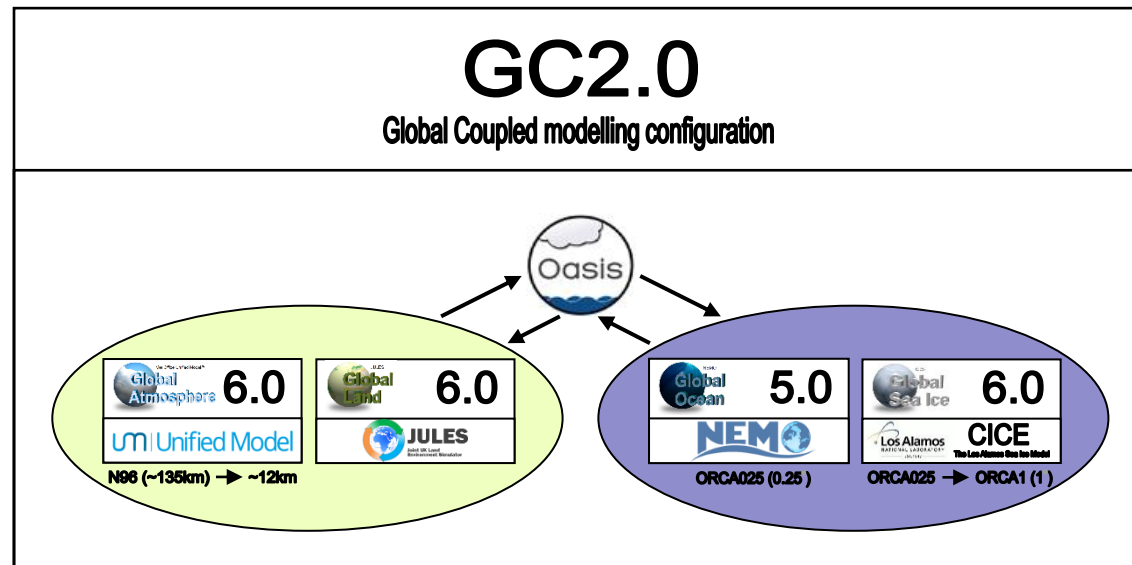

GloSea seamless EPS

Decadal Prediction

Climate Change studies

Global Coupled development across timescales

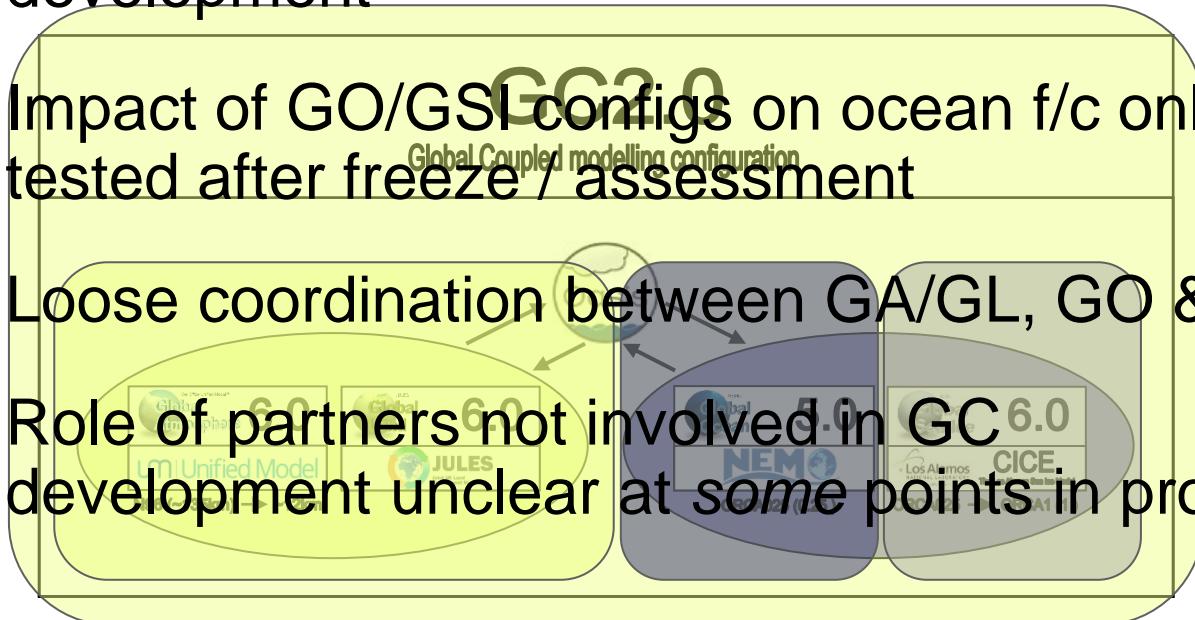

Governance of GC process

Current situation

- GA/GL & GC governed by INTEGRATE project
- GO/GSI governed by JOMP/JSIMP
- Initialised coupled runs not used much in development

- Impact of GO/GSI configs on ocean f/c only tested after freeze / assessment

- Loose coordination between GA/GL, GO & GSI
- Role of partners not involved in GC development unclear at some points in process

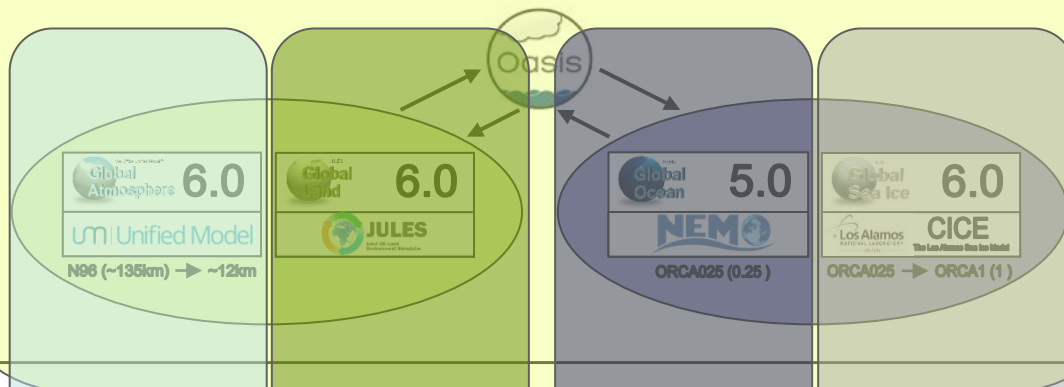

Governance of GC process

Proposed approach

GC development programme

GC2.0

Global Coupled modelling configuration

BAU dev activities:

UM consort.

JULES

JOMP

JSIMP

Non-GC users/applications

Summary

- GA/GL development process bedded in and delivering to users
- Current GC development “bolts on” to GA/GL development process
- Future GC development should better coordinate development of component models but allow each to continue to deliver to non-GC users
