

# Defining Observation Fields for Verification of Spatial Forecasts of Convection

Jennifer Mahoney, Barbara Brown, Joan Hart,  
Mike Kay, and Stacey Seseske

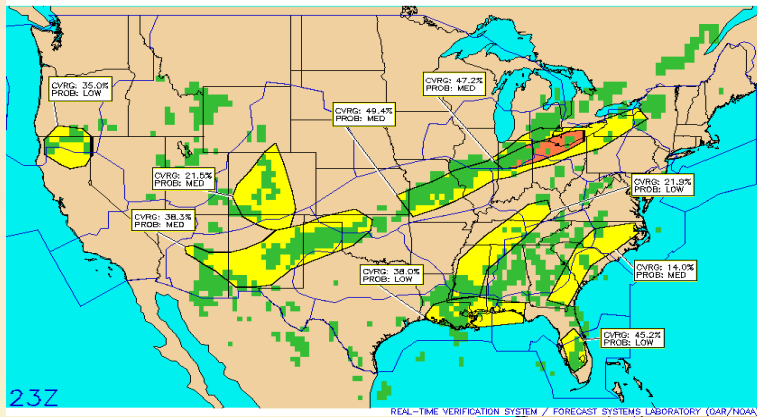

16 September 2004

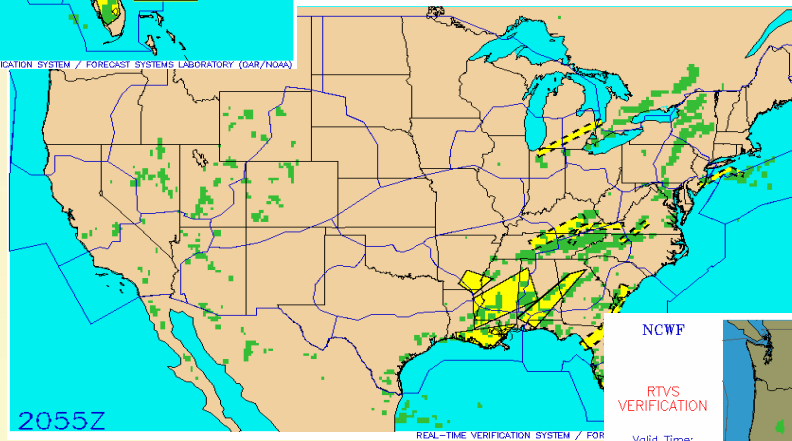

# Outline

- The convective forecast verification problem in an aviation context
- Defining observations that incorporate operational considerations and forecast attributes
  - Contrast old vs new verification strategy
- Application new strategy to 2004 evaluation of convective forecasts

# Convective Forecasts

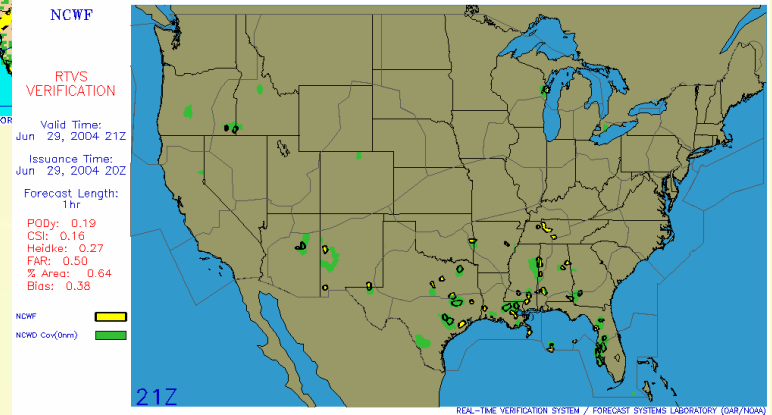

**CCFP**

**C-SIGMET**

**NCWF**

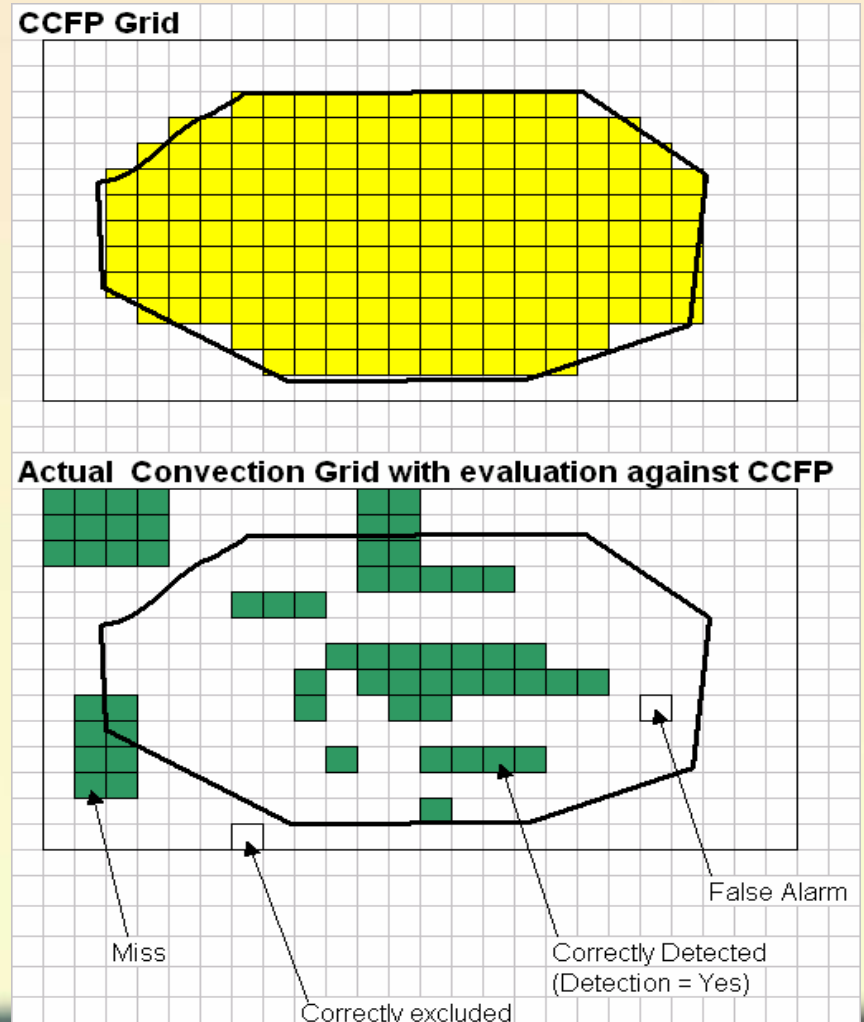

# Role in Convective Forecast Verification

- Determine which forecast is “better”
- Evaluate the quality of these forecasts using the same verification technique
- Evaluate the quality of the forecast as it is applied by the end user

# Old Verification Strategy

## Grid-based approach

- Binary comparison
- Compare forecasts with observations
  - Assume a forecast 'scale'
  - Overlay forecasts and observations
  - Test inclusion in forecast
- Methods consider the entire domain or sub-domain
- Compute coverage

# Defining the Observations

Issue: what convective activity affects the flow of air traffic

- Begin by defining the observations to meet user requirements
  - Understand what convectively impacts the flow of air traffic
- Defining observations to so they incorporate the forecast criteria.

1 - 06/26/2003 15:45 - NEXRAD 2km composite

# Re-defining the Observations

Basic assumption:

the area of significant convection impacts the flow of air traffic over some distance **and** extending away from the significant convective area

# Re-defining the Observations

## Define a Convective Constrained Area

- Builds on the Airmen's Information Manual (AIM) definition where a safe distance from convection is suggested
- Incorporate the user requirements for moving air traffic and forecast attributes

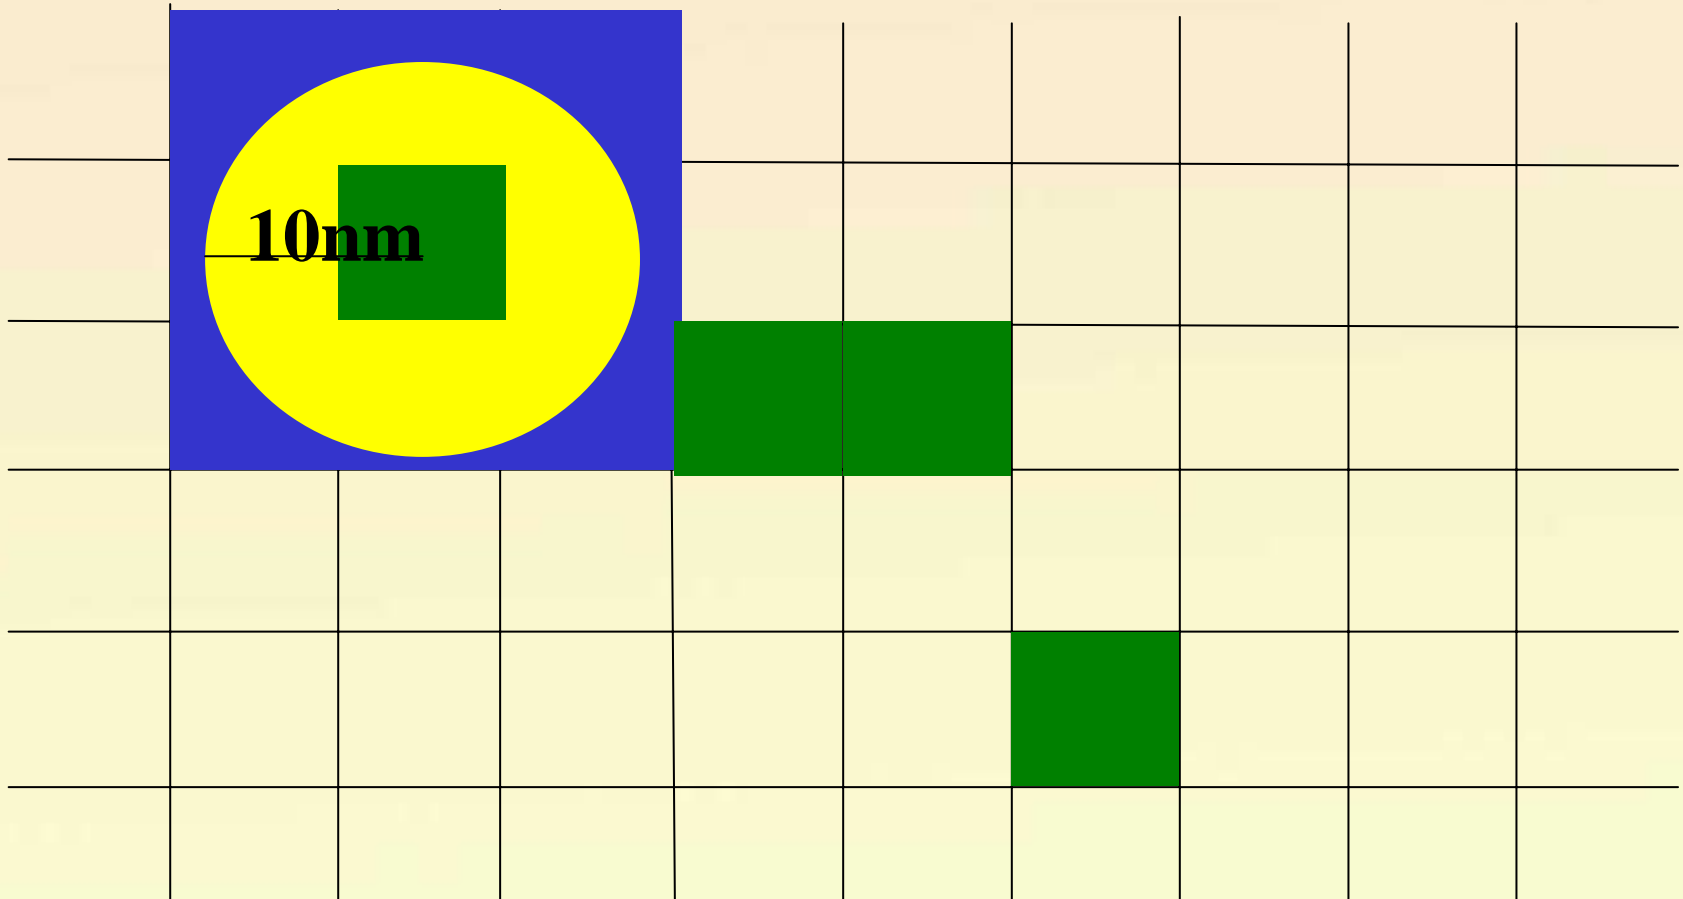

# Re-defining the Observations

## CCA

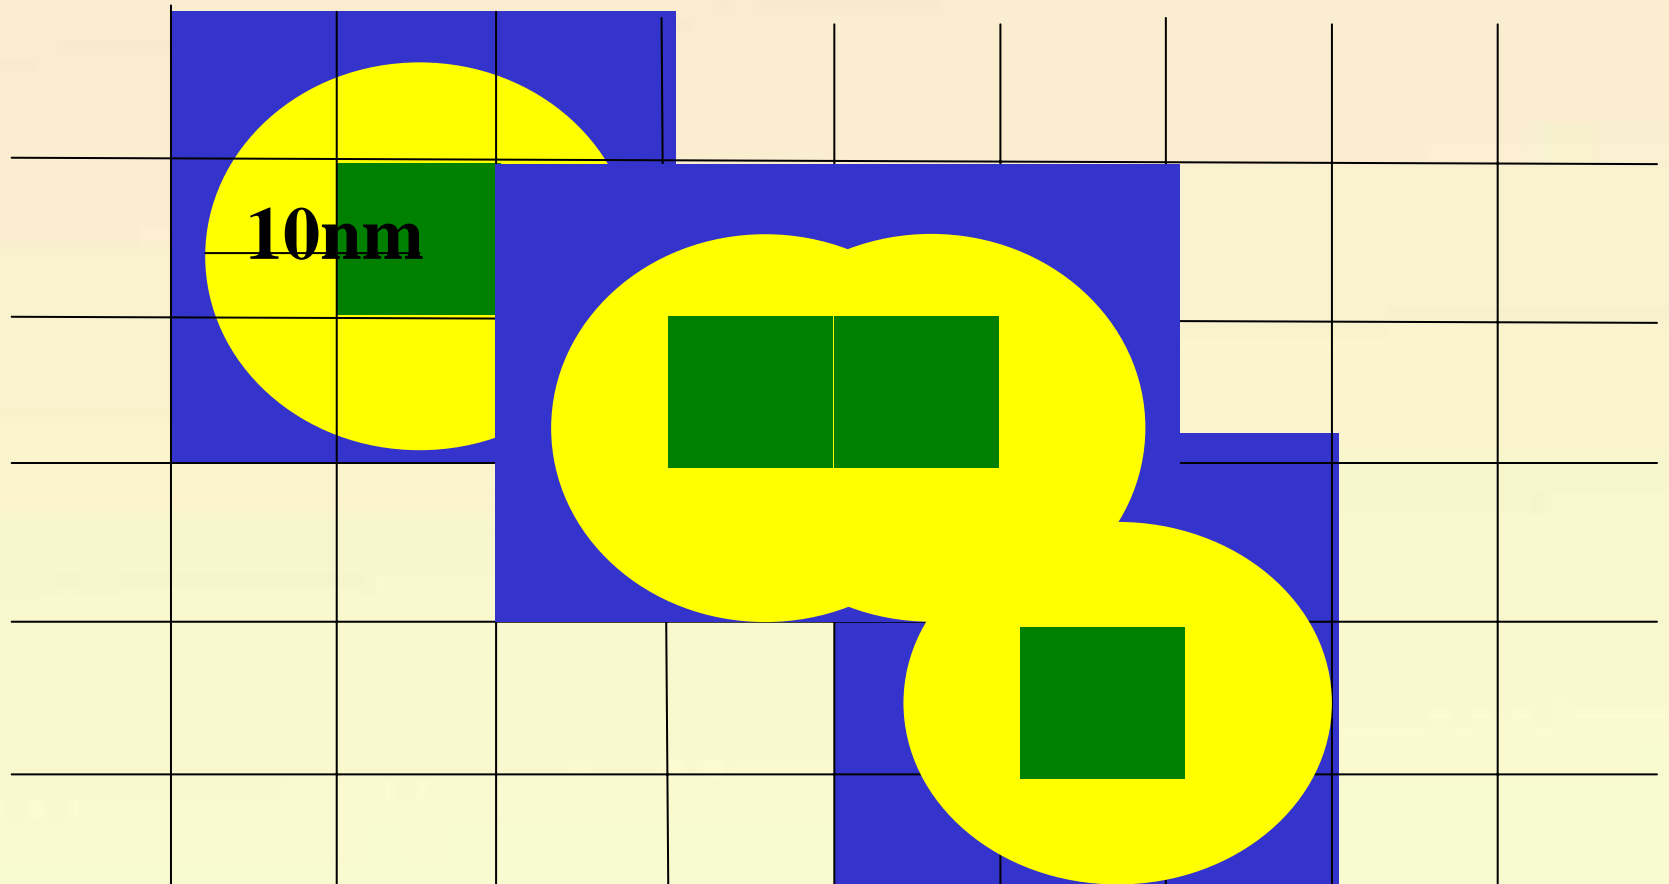

# Re-defining the Observations

## CCA

# Re-defining the Observations CCA

# Convective Constrained Area

# Raw Observations

# Convective Constrained Area

# Incorporate Forecast Attributes into the CCA

## Forecast Characteristics and Scale

- Develop search box that represents minimum forecast size of 3,000 sq mile (92x92 Km)
- Compute a coverage and apply to each box on the verification field

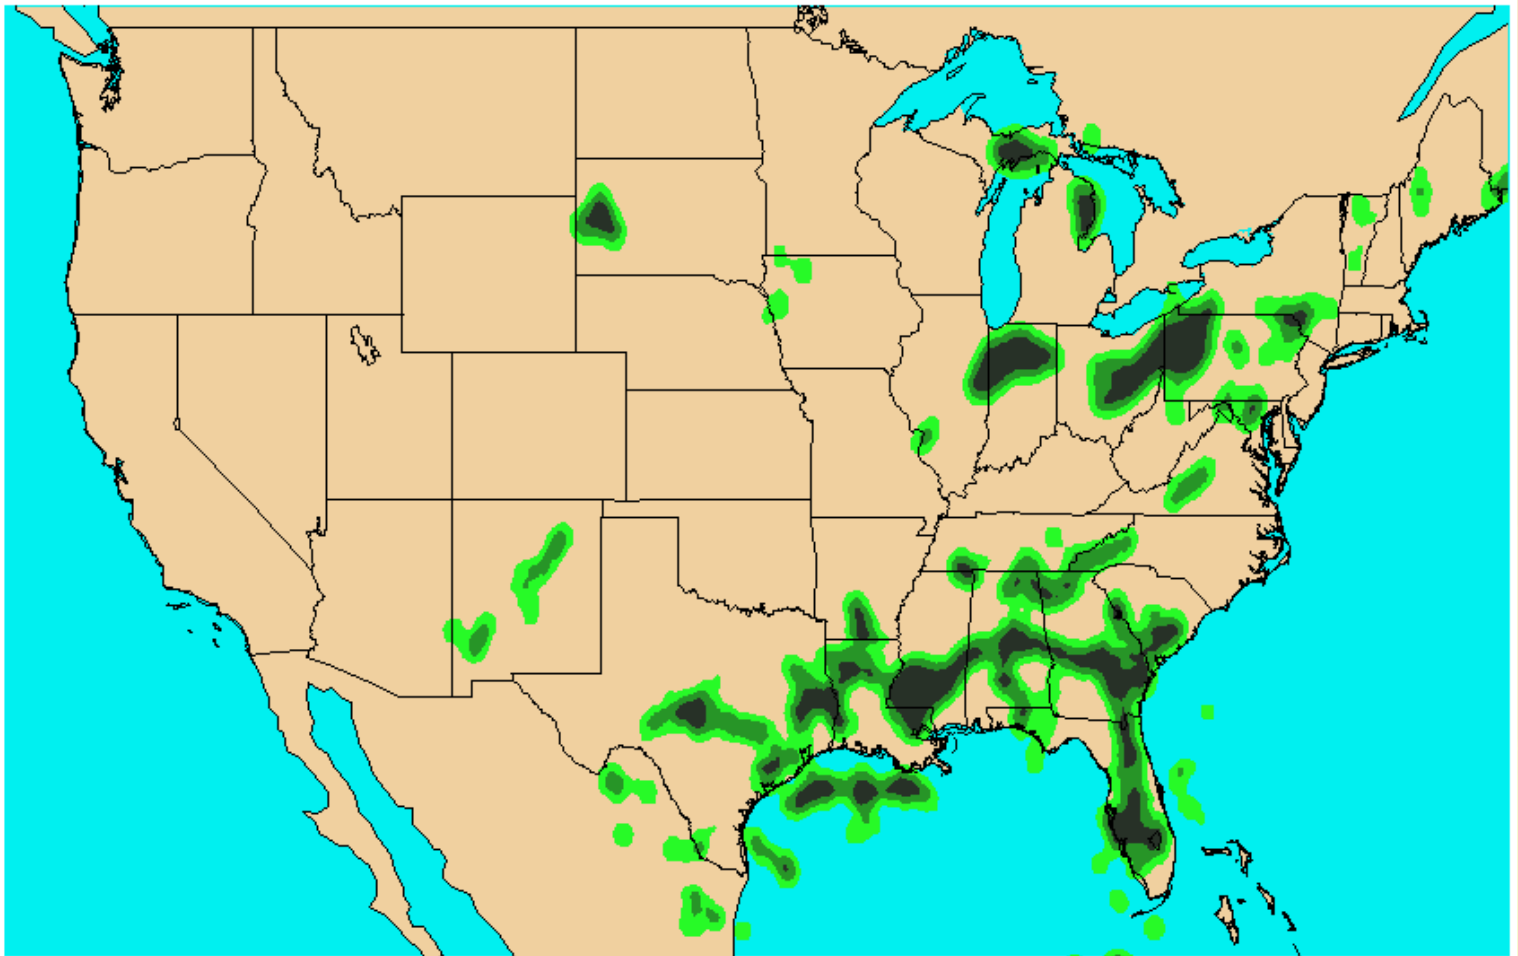

# Raw Observations

# Convective Constrained Area

# Verification Field

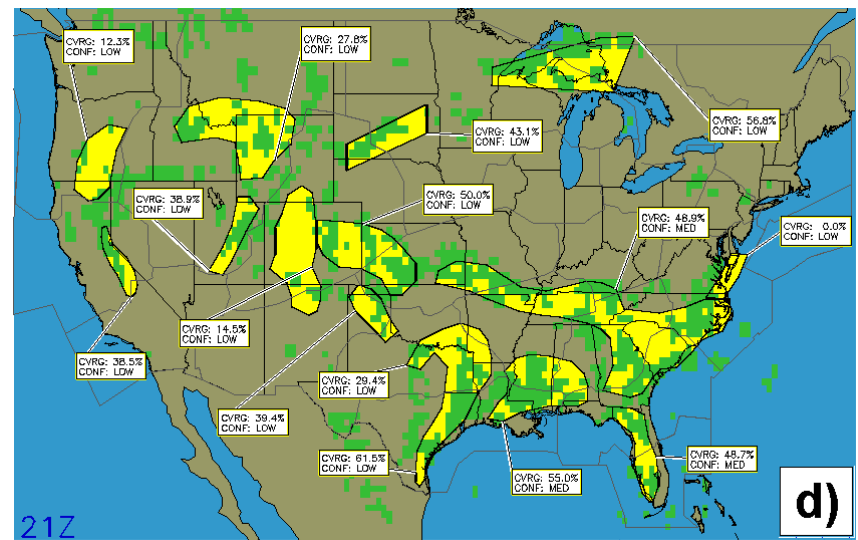

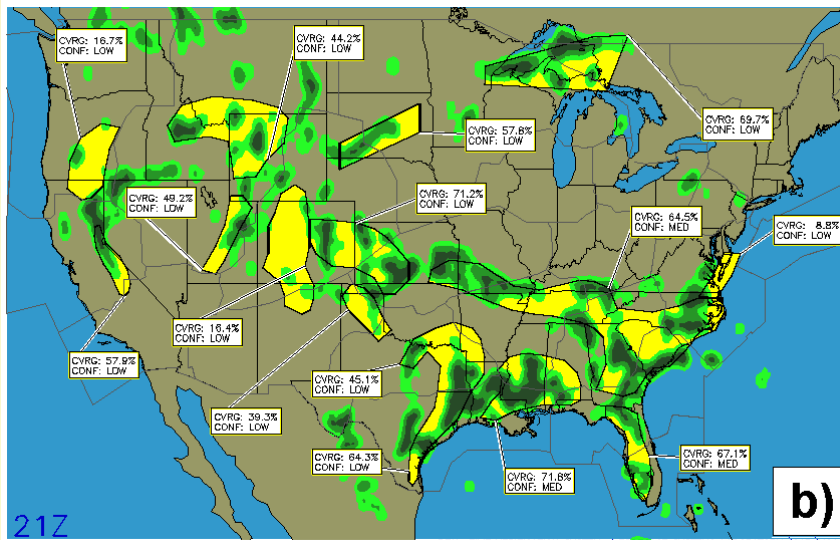

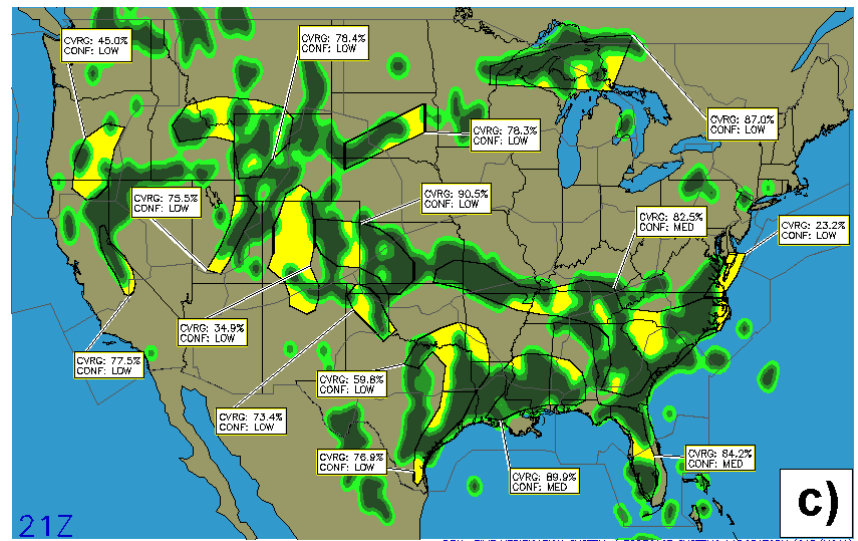

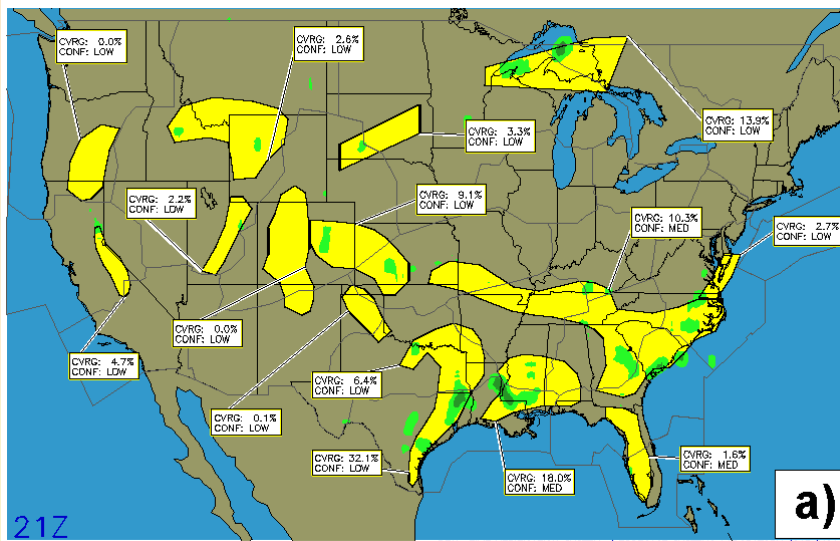

# 2004 Statistical Comparison

| Statistic              | Grid technique | CCA+Coverage |
|------------------------|----------------|--------------|
| <b>PODy</b>            | <b>0.31</b>    | <b>0.32</b>  |
| <b>PODn</b>            | <b>0.98</b>    | <b>0.98</b>  |
| <b>CSI</b>             | <b>0.18</b>    | <b>0.21</b>  |
| <b>TSS</b>             | <b>0.29</b>    | <b>0.30</b>  |
| <b>Heidke</b>          | <b>0.29</b>    | <b>0.33</b>  |
| <b>Gilbert</b>         | <b>0.17</b>    | <b>0.20</b>  |
| <b>Bias</b>            | <b>1.03</b>    | <b>0.82</b>  |
| <b>% Area</b>          | <b>2.8</b>     | <b>2.8</b>   |
| <b>Area Efficiency</b> | <b>10.8</b>    | <b>11.2</b>  |

# Re-defining Observations

- **Key issue** – size of the radius used to re-define the observations

# CCFP 2-h; 30 June 2004

# Skill Scores

| <b><i>% Area</i></b>    | <b><i>18.09</i></b> | <b><i>18.09</i></b> | <b><i>18.09</i></b> | <b><i>18.10</i></b>                    |
| <b><i>Bias</i></b>      | <b><i>8.63</i></b>  | <b><i>0.90</i></b>  | <b><i>0.56</i></b>  | <b><i>1.21</i></b>                     |

# Summary

- Important to define observations to reflect forecast attributes and forecast use
- Difficult to definitively define how to use the observations so that they do reflect the use of the product

# Future Work

- Determine how to justify a representative radius for the CCA (i.e., aircraft data)
  - Dependent upon region, time of day etc.
- Use the CCA as:
  - the basis for the object-oriented technique
  - nowcast to establish where the convection meets the forecast criteria
